

Total Economic Valuation of the National Park Service Lands and Programs:

Results of a Survey of The American Public

1. Summary

This paper presents the first-ever comprehensive estimate of the total economic value of the National Parks Service. The estimate covers administered lands, waters, and historic sites as well as NPS programs, which include protection of natural landmarks and historic sites, partnerships with local communities, recreational activities and educational programs.

Our estimate of the total economic value to the American public is \$92 billion. Two-thirds of this total (\$62 billion) is for National Park lands, waters and historic sites; the remaining \$30 billion is attributed to NPS Programs. The estimate, which is based on very conservative assumptions, includes not only the value attributed by visitors to the parks, but also a significant “non-use” or “existence” value. This is the value derived by the public from simply knowing that NPS assets are protected for current and future generations, regardless of whether or not they actually choose to visit.

Our results are derived from a survey of a sample of U.S. households conducted for this study. Participants were asked whether they would be willing to pay specific amounts in increased annual federal income taxes over a ten-year period in order to retain the current National Parks and NPS Programs. This methodology is consistent with the techniques employed by numerous Federal agencies for economic valuation. The results reflect rational economic behavior—the higher the dollar amount in increased taxation, the less likely respondents were to pay. This indicates respondents were paying close attention to the payment amounts and gives us high confidence in our economic valuation.

Overall, nearly 95% of responding households indicated that protecting National Parks, including historic sites, for current and future generations was important to them. This was largely independent of visitation; 85% of respondents felt that they personally benefitted from National Parks, regardless of whether they visited the parks or not.

This paper describes our methodology in detail, including survey development techniques and implementation, as well as our statistical analysis. The paper also considers the policy implications of this first-ever analysis of NPS value.

The study was conducted independently of the National Park Service. The research was funded through the generosity of the S.D. Bechtel Jr. Foundation, the Turner Foundation, Cody J. Smith of the Summit Foundation, the National Park Foundation and UPD Consulting Inc., and under the auspices of Colorado State University and Harvard University.

2. Introduction

The National Park Service (NPS) is an agency of the U.S. Department of the Interior founded in 1916. It oversees the system of National Park lands (national parks, national monuments, national recreation areas, national historic sites, and other units (hereafter National Parks), as well as numerous programs both within the parks and in communities throughout the country.¹

This paper presents the first-ever estimate of the total economic value of the entire National Park system and NPS programs, including both direct and passive use values.² Direct use values derive from on-site use, whereas passive use values are independent of on-site use. In each case we use survey data to calculate “net economic values”—how much people would pay over and above what they currently spend in order to enjoy National Parks and NPS programs. For non-visitors, these net economic values reflect the entire benefit.

Over the past 30 years a number of studies have looked at the amount the public would pay for individual units or specific benefits of the NPS system. These studies utilize a range of attributes, values and methodologies³. Other studies focus on the direct economic impact of visitor spending at National Parks in terms of jobs created or incremental tax revenues generated.⁴

The present study is the first to look at the NPS system as a whole. It addresses the broader question of the overall economic value to the American public (not only visitors, but also non-visiting households)⁵. The concept of passive use value was articulated by Krutilla (1967) as “...when the existence of a grand scenic wonder or a unique fragile ecosystem is involved, its preservation and continued availability are a significant part of the real income of many individuals.”⁶ Put another way, passive use values are the values people have which are “... independent of any present or future use these people might make of those resources.”⁷

¹ The NPS participates in numerous “cooperative programming” activities, in which the agency works together with local, state and other federal jurisdictions, NGOs and other stakeholders and interested parties to achieve its larger mission of promoting stewardship and recreation.

² Choi and Marlowe (2012) outlined a framework for such an analysis, in which they established a baseline methodology for valuing the NPS which they applied to a case study for Joshua Tree National Park. The paper won the Christopher P. Kaneb Prize for the Best Masters Student Paper awarded by The Harvard Environmental Economics Program.

³ Previous analysis of NPS visitation data using a travel demand method found a median value of \$108 per day (Neher, et al. 2013). Two other studies also used the travel demand method. Kerkvleit et al. (2002) applied the travel demand method to estimate the economic value of sport fishing in the Greater Yellowstone area (including within Yellowstone National Park). Heberling and Templeton (2009) estimated the value of recreation at Great Sand Dunes National Park in Colorado. Leggett et al. (2003) estimated the additional amount a household would pay to visit Fort Sumter National Monument in South Carolina. Douglass and Harpman (2004) used the contingent valuation method to assess the value of recreation at Lake Powell and the Glen Canyon National Recreation Area. Duffield (2006) estimates both use and non-use values for National Park System sites within the Colorado River Watershed. Schulze et al. (1983, 1985) used contingent valuation to estimate the value of air quality (visibility) in the National Parks in the Southwest (Grand Canyon NP, Mesa Verde NP and Zion NP). Welsh et al. (1997) estimated the passive use values associated with differing levels of water flow in the Grand Canyon National Park. Turner and Willmarth (2014) used a choice experiment to estimate both use and non-use values for resources within North Cascades National Park.

⁴ See Thomas, Huber and Koontz, 2014 for the most recent National Park visitor spending effects.

⁵ The study is part of a larger project whose goal is a complete economic assessment of the National Park Service, including ecosystem services, education, intellectual property and cooperative programming. See [Carbon Sequestration in the U.S. National Parks: A Value Beyond Visitation](#), *HKS Working Paper No. RWP15-007* (Banasiak, Bilmes and Loomis, 2015) and other papers in the series (forthcoming).

⁶ Krutilla, 1967, p779

⁷ Freeman 2003, p. 137

Passive use values include existence value and bequest value. Existence value is the utility or benefit that accrues to an individual from simply *knowing* that a resource (such as a National Park) exists, even if the individual never expects to visit or see or otherwise use the resource. Bequest value measures the benefit or utility an individual enjoys from knowing that a resource will be preserved for future generations.

Our study began with work by Choi and Marlowe (2012) that outlined a comprehensive framework for valuing the NPS, including economic impacts, intangible benefits from cooperative programs and non-market value.

While it is impossible to fully capture the value of priceless assets such as the iconic scenery and ecosystems protected in the National Parks, we have used an approach that measures what the American public would pay to avoid being *deprived* of these assets. Therefore this study is almost certainly a substantial under-valuation.

Additionally, we deliberately selected a highly conservative methodology and used conservative assumptions in conducting the survey⁸. For example, we attributed a zero value to all those who did not return the survey form—even though there are many reasons why people do not participate in surveys.⁹ We used a conservative method for weighting responses and for estimating respondents' economic values. In every step of the methodology we erred heavily on the side of conservatism.

Thus we believe that the \$92 billion in NPS economic value that we present should be viewed as the very minimum value that the American public places on the National Park Service system and programs.

⁸ See section 6 for a discussion of the conservatism of our approach.

⁹ We conducted a brief follow-up phone interview of a small subset of non-respondents to ascertain why they did not return the survey. These results confirm that non-response was primarily due to a reluctance to answer *any* survey rather than a negative perception of the National Park Service. Most did not answer the phone at all, 14% of those who did answer refused to participate in the three-question survey. Of the original non-respondents who agreed to participate in the follow-up, 79% indicated that they do not participate in long surveys.

3. Economic Valuation Methodology

Empirical Measures of Total Economic Value

Most of the economic value associated with the National Park Service is what economists call non-market value. There are no formal markets for such things as public lands recreation opportunities, clean air and threatened and endangered species so there are no market clearing “prices” for these goods as there are for traded goods such as food or clothes. At the broadest level, it is impossible to estimate the full value of protecting vital ecosystems and lands.

However, it is still important to determine at least a partial value for such protections, whose worth is vastly under-estimated by standard accounting and budgetary methods. Economic techniques are helpful in filling this gap. Economic values (including direct use and passive use values) are typically defined by economists as the maximum amount that an individual would pay rather than do without an increase in a particular good or service. This definition is referred to as “willingness to pay” (WTP) and is the federally approved measure of value used in cost-benefit analyses by a wide range of federal agencies including the U.S. Bureau of Reclamation (Welsh, et al. 1997; U.S. Water Resources Council 1983), U.S. Office of Management and Budget (1992), National Oceanic and Atmospheric Administration (Arrow et al. 1993), and U.S. Environmental Protection Agency (2010). WTP would clearly be the most appropriate value to estimate if additions to the National Park System and new programs were being proposed. However, given the overall budget situation facing the U.S. today, it was viewed by potential respondents as unrealistic to anticipate any significant additions to the National Park System over the next decade. Rather it is it was viewed as more likely there would be cuts to National Parks and NPS Programs, therefore the survey was based on this premise.¹⁰

When estimating the value associated with taking away a resource that the public already “owns” or is entitled to, economists generally use the concept of minimum “willingness to accept” (WTA) (Freeman, 2003). This is the minimum payment a person would accept in exchange for a one-unit decrease in a particular good or service. In a review of the literature on reported WTP and WTA, Horowitz and McConnell (2002) found that WTA was frequently twice as large as WTP for all types of goods, and as much as 10 times larger for non-market goods. Several explanations for this effect have been offered. These include the binding budget constraint that applies to WTP but not to WTA. As Freeman summarizes “These differences (between WTP and WTA) can be explained by the absence of close substitutes in the case of unique and perhaps irreplaceable resources...”¹¹ Hanemann (1991) also showed that if a person does not think there are good substitutes for the natural resource that could be bought for the money provided as compensation for giving up the natural resource, WTA could be larger than WTP by a sizeable amount. This is certainly applicable to the valuation of National Parks—given the uniqueness of many National Parks we would expect WTA to be substantially higher than WTP.

Given that the goal of the present study is to estimate the total economic value of all existing National Parks that the public already “owns” and has a legal right to, WTA would be the theoretically correct approach to estimating total economic value. However, economists have had limited success empirically estimating WTA in non-market valuation surveys. This may be due in part to the fact that it is rare for people to be asked if they are willing to give up an existing public resource in exchange for some amount of money (perhaps in the form of a tax refund). It is much more common, and therefore more familiar, for

¹⁰ During focus groups conducted to help formulate the survey instrument, participants said that they believed it was unlikely that the federal government would be able to add significantly to the National Parks Service holdings over the next decade, given the budget constraints facing the US. They did, however, view it as realistic that there might be cuts to the system. This discussion was independent of whether or not they believed it was desirable to expand the system. The focus groups are described in more detail below.

¹¹ Freeman 2003, p. 87

questionnaires to ask households if they would pay *additional* taxes of some form (sales, property, income) to provide *more* of a public good such as expanding schools, parks, open space, roadways, etc. It may be that the public has more experience with and therefore may find it more credible to be asked to pay rather than to accept payment. Thus, like most economists, we have used willingness to pay to retain the current amount of National Parks and NPS programs. This almost certainly generates results that are an underestimate of the true economic value of the entire the National Park System and NPS Programs.

Empirical Methods Used For this Study

As noted above, the majority of the economic value associated with National Parks and NPS programs is non-market value, which needs to be measured using techniques that do not rely on market prices. This can be done either indirectly or directly. *Indirect* measures of non-market values infer the value of the good in question by observing consumer behavior. For example, a common method to estimate recreation values¹² uses the estimated cost of a visit (direct expenses plus the value of travel time) as a price along with the quantity of trips taken to trace out a demand curve, from which the value of the recreation experience can be calculated (Champ et al. 2003).

Direct methods to measure non-market values are also referred to as "stated preference," because such techniques involve directly asking survey respondents what they would pay for their preferred alternative.¹³ Stated preference methods are the only methods which can estimate passive use values (Freeman, 2003) because people who have passive use values for a resource, such as existence and bequest values, rarely manifest these values in any traceable behavior. The two main types of stated preference methods are contingent valuation (CVM) and choice experiments (CE, also sometimes called contingent choice, conjoint method, or stated choice).

Contingent valuation (CVM) is a method whereby survey respondents are asked to indicate their willingness to pay for a non-market good like a recreation experience or passive use values such as existence value, option value or bequest value (Mitchell and Carson 1989). The choice experiment (CE) method is a stated preference method wherein survey respondents are asked to choose from a set of alternative scenarios which vary in the level of several attributes, one of which is the price or cost associated with each (Louviere et al. 2000, Bennett and Blamey 2001).

Boyle and Markowski (2003) and Turner (2012) both recommend using choice experiments when estimating economic values for National Park Service resources. Both also describe a comprehensive framework for developing estimates of value for National Park System resources and National Park Programs.

In addition, the choice experiment has several practical advantages over CVM. It is capable of gathering more information from survey respondents. Researchers can offer respondents more than the "take it or leave it" option of a CVM study, enabling respondents to choose their most preferred from a set of options or alternatives or to rank the options (Freeman 2003). The options contain differing levels of attributes, including a monetary attribute (the "price" of the option). The exercise presented to survey respondents most closely mimics the act of purchasing a market good, where consumers choose from among several options of a particular good such as a car, weighing the various models' attributes (one of which is the cost) in order to determine the most preferred (Louviere et al. 2000, Freeman 2003, Hensher et al. 2005).

¹² Commonly known as the travel cost or travel demand method

¹³ Stated preference methods were originally used to estimate recreation use value. Recreation use values can also be estimated with the actual behavior based methods called revealed preference methods. An example of a revealed preference method is the travel cost demand method of recreation behavior where visitors purchase gasoline and make observable recreation trips. However, revealed preference methods are incapable themselves to estimate passive use values since there is no observable behavior with passive use values. For a listing of recreation values see Loomis, 2005.

In addition, when analyzing the results of choice experiments, researchers are able to estimate the incremental willingness to pay (the economic value) for each of the non-monetary attributes of the preferred alternative (Freeman 2003). This is beneficial in our case in determining the overall value of National Park Service programs and units as well as determining which attributes of those programs and units are most valuable to the public.

Based on the recommendations and on the advantages of the choice experiment format for valuing the many different dimensions of the National Park System, the choice experiment method was selected as the most appropriate method to apply for our study.

4. Questionnaire Design and Survey Implementation

This section describes the steps used to develop and refine the questionnaire and the survey implementation process.

Questionnaire Development

Given the scale and complexity of the public good being valued, we believed it was essential to solicit input from potential respondents in order to ensure that our questionnaire design was clear and the questions phrased in clear, unambiguous language. The initial survey design was thus refined over several months with the aid of nine focus groups and six individual interviews conducted in Fort Collins and Denver, Colorado, Woburn, Massachusetts and South San Francisco, California. The focus groups each included about a dozen people randomly selected as representative of the general population. They were told that the purpose of the focus group was to help design a survey. A page of the survey was handed out and participants were asked to read it, mark up anything that was not clear, and answer the questions on the page. The moderator then went around the room and asked participants to explain their concerns with the text or the questions. This process was repeated for each page of the survey. The focus groups usually met for about two hours. We ran separate focus groups for the National Park units and for National Park programs so that adequate time was available to discuss each aspect of the survey in detail.

The input from these focus groups was extremely helpful in designing a survey that was clear to the general public and contained plausible scenarios regarding the budgetary issues facing National Park units and Programs and how these might be addressed. The focus group comments also resulted in a decision to design a single long (12 page) survey that included both National Park units and Programs.

The final questionnaire included questions on the National Park units and NPS programs. (see the Appendix for a copy of the full questionnaire). The first section contained a brief description of the National Park Service with examples of the various types of National Parks and NPS programs. National Parks were divided into three broad categories: (i) National Parks that focus on the preservation of nature and nature-based recreation, (ii) Parks that focus on the preservation of American history and culture or the commemoration and remembrance of significant events and people and (iii) Parks that focus on protecting shorelines and bodies of water. For nature-focused and water-focused parks we used acres as the unit of measure, but for the historic parks we used the number of sites. The reason for this is that the history-focused parks are often very small, representing less than 1% of the total NPS acreage, but account for 57% of total NPS units.

NPS programs were consolidated into four main focus areas: (i) Programs that focus on the preservation of local historic buildings and sites; (ii) Programs that create and improve recreation opportunities for communities; (iii) Programs that focus on the protection of natural environments and features that are important to communities and (iv) Educational Programs that help children and adults learn about historical, cultural and environmental topics.¹⁴ Each of these is described in terms of annual outputs. Tables 1a and 1b below show the Park and Program attributes respectively along with the specific metrics used for each (the full descriptions can be found in the example questionnaire in the Appendix). In the questionnaire these divisions are denoted using icons and colors that are carried through the questionnaire.

¹⁴ NPS administers a wide range of programs. For the purposes of this survey, we focus on four major programmatic areas: conservation, education, historical preservation, and recreation.

Table 1a. Attribute Descriptions – National Parks

<i>Types of National Parks</i>	<i>Metric</i>
National Park areas that focus on the preservation of nature and nature-based recreation (e. g. National Parks, some National Monuments, National Preserves, National Parkways, National Scenic Trails and some National Recreation Areas).	Acres: 79,096,632
National Park areas that focus on the preservation of American history and culture or the commemoration and remembrance of significant events and people (e. g. National Historic Sites, National Battlefields, National Memorials and some National Monuments).	Park units: 226
National Park areas that focus on protecting shorelines and bodies of water (e. g. National Lakeshores on the Great Lakes, National Seashores, National Rivers and some National Recreation Areas).	Acres: 4,818,275

Park acreage, number of sites and program outputs are all from various National Park Service publications or personal communication with NPS from 2012 to 2013.

Table 1b. Attribute Descriptions – National Park Service Programs Outside of National Parks

<i>Types of NPS Programs</i>	<i>Metric</i>
Preservation of local historic buildings and sites which commemorate American history and culture or significant events and people.	Annual number of historic sites protected: 2,000
Creation and improvement of recreation opportunities for communities.	Annual number of acres transferred: 2,700
Protection of natural environments and features which are important to communities.	Annual number of sites designated: 114
Educational programs which help children and adults learn about historical, cultural and environmental topic.	Children attending programs annually: 4,100,000

Acreage, number of sites and program outputs were based on National Park Service publications and/or personal communication with NPS personnel from 2012 to 2013. Children attending educational programs was calculated based on the 2012 NPS estimate and materials prepared by Dr. Milton Chen, Edutopia, February 2013.

The second section of the questionnaire consisted of twelve Likert-scale style questions designed to elicit respondents' general attitude toward the NPS, National Parks, and outcomes of the NPS programs. This was followed by a detailed description of the National Parks and NPS programs and the valuation questions. Focus group feedback indicated that valuing a hypothetical major increase in either National Parks or NPS programs was viewed as unrealistic. Thus the scenario we presented to respondents was a proposal to sell some National Park lands and cut some NPS programs as a response to budget shortfalls. This was credible to respondents and has some validity as there are occasional political proposals along these lines.

In order to minimize the potential for hypothetical bias (where respondents indicate a higher willingness to pay than they would actually pay in cash), the description above was followed by a caution which asked respondents to consider their budget as well as the combined cost of both proposals when choosing their preferred options. This technique is based on the work of several researchers (Cummings and Taylor 1999, Carlsson et al. 2005, Silva et al. 2011) and has been shown to help reduce the tendency for respondents to overstate their willingness to pay.

Respondents were presented with two choice questions, one on National Parks the other on NPS programs. The park and program categories described above were used as the non-price attributes (three for parks, four for programs). The choice questions each consist of three options. The status-quo (or "do nothing") option proposes the highest levels of cuts, with a tax cost of \$0. The middle option proposes

smaller cuts and some annual tax cost. The third option for each choice question preserves all current parks or programs with the highest annual cost to the household.

We chose an annual increase in federal income taxes as a realistic means of payment to prevent the sale of National Parks or to avoid cuts to NPS programs. While taxes may obtain “protest” responses, where a survey respondent rejects the payment due to something other than a true zero valuation of the good (e.g. attitudes toward the federal government in general or objections to paying by means of taxes), this type of payment vehicle has desirable consequentiality properties that aid in obtaining valid willingness to pay responses (Carson and Groves, 2007). To check for protests, each choice question included a follow-up question asking for the reason where the willingness to pay was indicated at zero.

The final overall survey design consisted of 16 versions of the questionnaire.¹⁵ Each version varied the percentage of cuts to National Parks and NPS Programs, and varied the amount of the associated increase in income taxes the respondent would be asked to pay.¹⁶ The levels of those values are shown in Table 2. Note that the options with the maximum sale of National Parks and maximum cuts to NPS programs (described in the survey as the status quo) vary only in the level of cuts, and the price is always zero. The options with no sale of National Parks and no cuts to NPS programs is the highest price option and vary only in the household cost (the percentage of land sold or cuts to programs is always zero).

Table 2. Choice Question Attribute Levels

<i>Option</i>	<i>Non-Price Attribute levels Cuts to programs or sale of parks</i>	<i>Price levels/Income Tax Cost Household’s annual federal income tax cost for each of the next 10 years</i>
Maximum sale of National Parks / maximum cuts to NPS programs	20%, 25%, 30%, 40%	\$0
Smaller sales of some or all National Parks / smaller cuts to some or all NPS programs	0%, 5%, 10%, 20%	\$15, \$25, \$35, \$50, \$60, \$75, \$90, \$100
No sale of National Parks / no cuts to NPS programs	0%	\$115, \$150, \$200, \$250, \$300, \$350, \$400, \$500, \$600

Each of the choice questions followed the same format, which incorporated the icons and color codes used in the description of National Parks and NPS program types (the option attributes) along with color-coded pie charts graphically illustrating the reductions (sale of National Parks or cuts to annual NPS program outputs). Respondents were asked to first indicate their *most preferred* option, then their *least preferred* option.

The valuation section concluded with two questions designed to elicit respondents’ perspectives on the consequentiality of the questionnaire (Carson and Groves 2007, Vossler and Evans 2009). One asked respondents how certain they were that their answers would be used to make policy decisions. The second asked how certain they were that they would actually have to pay the proposed tax.¹⁷ Respondents giving zero WTP were asked the reason for this valuation.

¹⁵ The full design is available from the authors upon request

¹⁶ Barbara Kanninen of BK Econometrics guided the design of the 16 versions.

¹⁷ Some focus group participants expressed worry that that the government would use responses to their surveys to decide whether and how much to reduce National Parks - showing that they did take the process seriously.

Sample Design

This section discusses the overall sample design, including sources of potential problems and ways of mitigating them.

The first decision point in determining the survey sample design is to identify the affected population—the group to which the benefits and/or costs of the good being valued accrue. This is most straightforward when the population that will benefit is the same as the population that will pay for the good in question. In the case of the total economic value of the NPS, this population is all U.S. households.

The next step is to devise a sampling frame that ensures the sample is representative of the affected population. In order for the results of the valuation survey to be generalizable to the entire population, the sample must be unbiased—that is every member of the affected population (in this case all U.S. households) must have an equal probability of being selected for the sample (Mitchell and Carson 1989). The extent to which the sample is unbiased will depend upon the method of generating the sample (which to some extent will depend upon the survey mode, discussed below).

Using households listed in telephone directories (for either phone or mail surveys) is a common method of generating a national household sample. However such a sample could potentially be biased for excluding households without landline telephones (an increasingly common situation due to the prevalence of cellular phones) as well as households with unlisted telephone numbers. Random digit dialing (RDD) of area codes and both landline and cell phone prefixes provides reasonably good coverage of the U.S. population. RDD has become commonplace among most university survey research centers and private survey sampling companies.

Internet panel surveys require access to the internet. Some survey research firms overcome this problem by providing potential panel members with computers and internet connections. Such panels have the potential to result in self-selection bias (since they exclude households whose members are unwilling to participate in internet surveys).

To avoid these sampling problems, survey researchers are increasingly turning to address-based samples. Our sampling frame consists of all U.S. households with valid addresses contained in the U.S. Postal Service Delivery Sequence file. According to the Wyoming Survey and Analysis Center, “This is the sampling frame that is recognized to provide the best coverage of all households in a geographic area of interest at reasonable cost.” The Center calculated that random samples yielding 600 completed surveys “...will yield margins of error of about ± 4 percentage points, with 95% confidence.”¹⁸

Survey Mode

Survey mode refers to the means by which the survey questionnaire is delivered to potential respondents. Modes include mailed questionnaires, phone surveys, a combination of telephone and mail and, more recently, the Internet. Some survey modes, such as in-person surveys, may produce higher willingness to pay values due to respondents wishing to please the interviewer (Leggett et al. 2003).

Recent research has indicated that a mixed mode approach (combining online, mail and/or phone) may increase response rates and the representativeness of the final sample (Grandjean et al. 2009, Taylor et al. 2009, Poole and Loomis 2010, Kaplowitz et al. 2004, Evans and Mathur 2005, Lindhjem and Navrud 2011, Berrens et al. 2004). Hence in our survey we used a mixed internet-mail mode.

¹⁸ Wyoming Survey and Analysis Center (2013).

Survey Implementation and Response Rates

Our report presents the results of two separate rounds of surveying done in 2013-14 and 2015. The procedures followed for the two survey rounds were nearly identical. All members of the survey sample were initially invited to participate in the survey by means of a paper letter on letterhead with both Colorado State University and the University of Wyoming mailed to their home address. The letter provided a web link to the survey in the form of a unique URL. A few weeks later, non-respondents in both rounds were mailed a second paper letter which repeated their survey web link, but also included the 12-page color paper questionnaire (with a postage paid return envelope) and a two-dollar bill as an incentive/reward.

In the first round (2013-14), non-respondents for whom phone numbers were available were contacted by phone with a reminder message. A third reminder letter with a web link was sent a few days later. The final contact in the first round included a second paper questionnaire and web link mailed to non-respondents. In the second round (2015), non-respondents were sent a reminder postcard about two weeks after the first paper questionnaire was mailed. Then two waves of phone calls were made—one immediately after the reminder postcard and the second after a second paper survey was mailed about a month later. Details of the survey processes are shown in Table 3.

Table 3. Survey Procedures for Two Survey Rounds

	<i>Round 1: 2013-14</i>	<i>Round 2: 2015</i>
Initial paper letter describing the survey, with unique web link for online response	late Nov 2013	late April 2015
Second letter with paper questionnaire and web link	early Dec 2013	mid-May 2015
Reminder postcard	N.A.	late-May 2015
Reminder phone calls	mid-Dec 2013	late-May and late-June 2015
Reminder letter with web link	late-Dec 2013	N.A.
Reminder letter with replacement paper questionnaire and web link	late-Jan 2014	mid-June 2015

The 2013-14 sample included 1,630 valid addresses with 317 questionnaires completed (for a 19% response rate). The 2015 sample included 2,246 valid addresses and 391 completed questionnaires (17% response rate). We pooled the data from the two survey rounds after determining that the samples were not statistically different from each other. The results reported in the remainder of this paper reflect the pooled sample. The pooled sample has about 700 observations, well over the minimum sample size of 500 that is recommended for conjoint/choice experiment (Orme, 2010).

The overall response rate was 18%. While this is lower than we would have liked, we should note the National Research Council (NRC) has documented the general decline in survey response rates over the last decade (2013).¹⁹ Even some official U.S. Census Bureau of surveys of the general public are in the

¹⁹ Our response rate is similar to other stated preference survey response rates. For example, the recent Elwha River restoration study had a response rate of 24% (Stratus Consulting, 2015), compared with response rates in earlier Elwha studies of 68% for the state of Washington and 55% from the rest of the U.S. (Loomis, 1996). Two main factors contributed to the low response rate. The first is the target population. National surveys of the general public tend to have the lowest response rates. State specific surveys of the general state population often have higher response rates, and community surveys (specific to a particular community and on particularly relevant topics) generally have the highest response rates. In addition, longer surveys have lower response rates, dropping off steeply as surveys reach 8 pages and again when they reach 12 pages. Our response rate of 18% is comparable to several recent surveys conducted by the Wyoming Survey and Analysis Center. The most similar survey to ours, a 12-page survey of the general public in Utah on recreation resulted in a 20% response rate (Brian Harnisch, Wyoming Survey and Analysis Center, personal communication, 2016).

range of 10% to 30% (NRC 2013).²⁰ The NRC report suggests that ex-post survey weighting of the data may help to reduce risks associated with a low response rate.²¹ One of the weighting techniques they recommend that is widely used is “raking ratio adjustment” (page 3-4) because it can account for multiple variables that might differ somewhat between the sample and the population. Our use of the raking approach is discussed in Section 5 (Statistical Analyses and Results) below.

Sample Demographics

Only 27% of respondents chose the online survey mode; 73% returned the paper questionnaire. The raw sample is older, more highly educated and has a higher income than that of the United States as a whole, which would reduce the generalizability of the findings to the population as a whole (Table 4) if no statistical corrections are made.²² As explained below, we used statistical models to weight the sample so as to be representative of the U.S. population on key characteristics that influence economic valuation.

Table 4. Population and Sample Demographics

	<i>Median Age</i>	<i>Female (% over 15 years)</i>	<i>Median HH Income (\$)</i>	<i>Bachelor’s Degree or More (%)</i>	<i>Retired (%)</i>
<i>Survey sample</i>	57	53%	62,500 ^b	51.13	39.7
<i>United States^a</i>	37.3	51.6	52,250	18.73	16.2 ^c

^a Sources: U.S. Department of Commerce, Census Bureau, American Fact Finder (2012) and U.S. Social Security Administration.

^b The sample median income falls within the range \$50,000 to \$74,999, the number reported here is the mid-point.

^c Based on 38,000,000 retirees as reported by the SSA and the U.S. population over the age of 18.

Fifty-nine percent of survey respondents reported having visited a National Park in the last two years. This compares to an independent survey regarding visitation to National Parks that indicated 47% of the American public had visited a National Park (Taylor et al. 2011). Only 8% of survey respondents indicated membership in environmental organizations.

As another check on the representativeness of our sample, we compared sample National Park visitation to the visitation levels reported in National Park Service annual reports. According to those reports, the average annual number of recreation visits for 2012-2015 was 283 million. Using our survey respondents’ reported visitation frequency we calculated a weighted average per household annual visitation. Applying this to the total number of households in the U.S. and using the average household size, our data implies an annual visitation of 248 million, quite close to the average number of recreation visits reported by NPS.

²⁰ Public response rates for the US Decennial Census have fallen from 78% in 1970 to 63% in 2010, despite significant spending by the US Census Bureau on media advertising to increase the mail back rate.

²¹ We conducted a follow-up survey of non-respondents to ascertain the reason for their non-response. The Wyoming Survey and Analysis Center (WYSAC) provided us with a list of non-respondents from the 2015 survey. We removed all those with disconnected phones, wrong numbers and phones that were not associated with a private household leaving a total of 438 numbers. Over the course of three days (June 14-17, 2016) 221 calls were made to a subset of the 438 eligible phone numbers. The responses provide some indication that most of the non-response was due to unwillingness to answer surveys (based on both the responses to the questions and on the high rate of refusal to participate in even a three question survey in this follow-up exercise), and did not suggest dislike of the National Parks. Half of those responding indicated that they had visited a National Park in the last two years; and 80% of those reached disagreed with the proposition that the U.S. government should sell off some National Parks. This provides us with confidence that we have been conservative in attributing a zero value to non-respondents.

²² The descriptive statistics present the raw results from the survey. The weighted sample was used to determine the economic valuation values.

Responses to Attitudinal Questions

Most respondents indicated support for National Parks and NPS programs, as indicated by the responses to the Likert scale questions (Table 5). These were the first questions following the survey introduction and the description of the various types of National Park areas and programs.

Table 5. Attitudes Toward the National Park Units and NPS Programs

<i>Statement</i>	<i>% of respondents who agree^a</i>
1. It is important to me that historic sites are protected for current and future generations whether I visit them or not.	94.9%
2. National Park areas are good places to bring children to learn about nature.	96.2%
3. Local governments do not need any help from the National Park Service to protect local historic sites and buildings.	14.6%
4. I enjoy visiting historic sites and buildings.	89.8%
5. The U.S. should sell off some National Parks.	6.2%
6. Local governments should be able to provide trails, parks and open spaces in communities without the help of the National Park Service.	39.9%
7. I enjoy using local trails, parks and open spaces in my community and in other places.	86.6%
8. I do not benefit directly from National Parks.	14.7%
9. Private businesses could probably do a better job than the federal government at protecting local historic sites and buildings.	22.2%
10. It is important to me that trails, parks, and open spaces in communities are protected for current and future generations, whether I use them or not.	93.5%
11. National Parks are important to me because I enjoy visiting them.	80.8%
12. It is important to me that National Parks are preserved for current and future generations whether I visit them or not.	94.8%

^a Percentage of respondents indicating they either “agree” or “strongly agree” with the statement

The 2015 survey round included an additional question on respondents’ political point of view (Table 6). It is interesting to note that the unweighted sample is generally somewhat politically conservative, but nonetheless supportive of protecting National Park lands, waters, and historic sites as well as NPS programs in general.

Table 6. How would you describe your overall political point of view?

Leaning Democratic	9.21%
Mostly Democratic	14.83%
Leaning Republican	17.39%
Mostly Republican	23.27%
Completely Independent	21.99%
Not sure	9.97%
Did not answer	3.32%

Responses to WTP Valuation Questions

Additional evidence of support for the National Parks and NPS programs is found in the large percentage of respondents willing to pay some amount to prevent cuts. Table 7 below shows the least preferred option selected by respondents, grouped according to the most preferred option selected. Column headings show the most preferred option and row labels show the breakdown of least preferred option for each group. (Note that for each of the options a few respondents indicated the same option as both their most preferred and least preferred, indicated by *italicized* text). The row indicating “did not answer” refers to those respondents who answered the “most preferred” question but did not answer the “least preferred” question. The column total is percentage of the sample who selected that option as “most preferred.” This row sums to the total percentage of respondents who answered the “most preferred” question (which is less than 100% of the sample).

Table 7. Responses to Most Preferred and Least Preferred Option

Parks		Most Preferred Parks Option		
		Option A - Sale of some land in all parks	Option B - Smaller lands sales in some or all parks at low cost	Option C - No sale of parks at higher cost
Least Preferred Option	Option A	<i>1.69%</i>	18.36%	41.95%
	Option B	0.14%	<i>1.69%</i>	3.25%
	Option C	9.75%	10.88%	<i>3.67%</i>
	Did not answer	1.13%	0.71%	0.56%
	Total	12.71%	31.64%	49.44%
Programs		Most Preferred Program Option		
		Option D - Cuts to all programs	Option E - smaller cuts to some or all programs	Option F - no cuts to programs at higher cost
Least Preferred Option	Option D	<i>1.84%</i>	24.14%	26.93%
	Option E	1.13%	<i>1.98%</i>	1.72%
	Option F	12.71%	16.81%	<i>1.72%</i>
	Did not answer	0.71%	1.55%	1.41%
	Total	16.38%	45.48%	31.36%

Table 8 shows responses to the consequentiality questions that elicit respondent's views of the significance or importance of their answers in shaping policy regarding NPS parks and programs. About half of the respondents were uncertain that their answers would be used to inform policy decisions (48.9% responded that they were either “uncertain” or “very uncertain” that the results would be used to formulate policy). However many respondents are certain they would have to pay the tax (47% responded that they are either “certain” or “very certain” that they would have to pay the tax described). This last response suggests that many respondents treated their answers as potentially having real tax consequences to their household.

Table 8. Respondent beliefs about consequentiality of the survey

	<i>Answers will be used for decisions</i>	<i>Will actually have to pay tax</i>
Very certain	5.79%	17.23%
Certain	9.18%	31.36%
Neither certain nor uncertain	34.04%	29.38%
Uncertain	29.24%	13.42%
Very uncertain	17.66%	4.24%
Did not answer	4.10%	4.38%

Since we chose annual increase in federal income taxes as a realistic means of payment to prevent the sale of National Parks or to avoid cuts to NPS programs there is a possibility that some respondents indicated a WTP of zero as a “protest” of the payment vehicle. A protest response occurred when some premise of the National Parks or NPS Program scenario was rejected by the respondent (for example, they were opposed to the concept of taxes as a way to pay for retaining parks). Thus their response reflects a protest against how they are being asked to pay rather than the true value that they ascribe to the public good. Protest zeros could reflect attitudes toward the federal government, objections to paying taxes, or even objections to the survey in general.

To attempt to separate protest responses from valid zero WTP responses, we asked respondents selecting the maximum sale/maximum cut a follow-up question about the reason for their zero WTP. Thirteen percent of respondents who indicated a willingness to pay of zero for the National Parks choice question and 17% of zero WTP respondents to the Programs choice question indicated that either they could not afford the amount or that the National Parks or NPS Programs were not worth the amount asked. This indicates that respondents were, in fact cognizant of their budget constraints and of their personal valuations for the National Parks or NPS Programs. Such reasons for a zero WTP are *not* a protest since zero reflects the true willingness and ability to pay.

Only about 7.5% of respondents to the National Parks choice question (58.9% of those choosing Option A) and 9.2% of respondents to the programs choice question (56% of those choosing Option D) were determined to be general "protest" responses (see the appendix for more details on the protest responses).²³ This relatively low rate of protest response suggests that our “simulated market” and scenario was accepted by more than 90% of respondents. It should be noted that *we included all responses* to the questionnaire, even though it is acceptable to delete protests as not reflecting the respondent’s true value (Mitchell and Carson 1989). Retaining the protest households who declined to pay provides a conservative estimate of overall willingness to pay.

²³ Some respondents who selected Options B or C for Parks, or E or F for Programs (indicating a willingness to pay greater than \$0) answered the protest detection question and some of these responses could also be construed as protests. These are noted in Table 8. If these are included the total, protest responses increase for Parks to 12.4% and to 14.8% for Programs.

5. Statistical Analyses and Results

The survey asked respondents to select the most preferred and least preferred among three different options for both Parks and Programs. This approach enables us to infer a ranking for the three options. The most preferred option alone provides only an indication of the respondents' top choice and does not contain as much information about the respondent's values as a ranking of all three options. Using the additional information in a rank-ordered logit (logistic regression) provides more efficient estimators for the coefficients. This in turn allows us more confidently to derive incremental (marginal) values for the various attributes of the National Parks and NPS programs.

The attributes for the National Parks are the remaining acres (or sites) of each of the three types of park after any sales are made. Option A includes sale of some land in all types of parks (in varying amounts). Option B includes smaller sales of land in some or all types. Option C has no land sales. The three options for programs are similar: one with cuts to all types, one with smaller cuts and one with no cuts. The attributes for programs are the amounts of the annual flow of outputs remaining for the four types of programs after any program cuts are made.

By using most preferred and least preferred options, the data can be configured into what is essentially a panel with each respondent having three lines of data (one for each of the three survey options). Each of these lines of data includes the attribute levels of that option (including price) and the implied rank of that option derived from the most preferred and least preferred (incomplete responses were dropped from the analysis). We then used the implicit ranking of each option as the dependent variable in a rank-ordered logit model with the attribute levels for each option as the right-hand-side explanatory variables.

As described above, our raw sample is not completely representative of some demographic characteristics nor of the National Park visitation rate of the population as a whole. However, as a first step we estimated the rank-ordered logistic model without any adjustments for such differences. Although this model performed well, we felt that the incremental (marginal) and total economic values might not reflect the population's true willingness to pay.

To adjust for differences between respondents' National Park visitation rates and sample demographics, we used a statistical routine to reweight the sample observations to reflect population characteristics.²⁴ Weighting by visitation yielded the most conservative valuations. Furthermore, since demographics are often determinants of National Park visitation (Henrickson and Johnson 2013, Neher et al. 2013), weighting on visitation may implicitly adjust for demographics as well.

We also employed a sample weighting procedure to adjust for differences in income and other demographics (based on the U.S. Census) and visitation rate. The statistical software used for these analyses (Stata) includes an algorithm ("ipfweight") for adjusting sample proportions to conform more closely to population proportions (called "raking"). The algorithm generates a weight variable for each observation through an iterative process based on the values for the population as a whole. For our analysis we created three different weights. One adjusted for differences in education level, age, income, race and work status (retired or not). A second adjusted for all of these demographic characteristics plus the proportion of the population that visited a National Park. The final weighting accounted only for

²⁴ Specifically, the statistical software (Stata) constructed a weight for each respondent based on their specific demographic characteristics relative to the U.S. population by comparing the survey sample proportions with the proportions based on the most recent U.S. Census. For example, less educated, younger minorities are underrepresented in the sample, so these respondents' answers were given a larger weight than more educated, white retirees with higher incomes (who were over-represented in the sample). National Park visitors are also overrepresented and thus were weighted less than non-visitors. We constructed three sets of weights—one based on demographic characteristics only, one based just on visitation and a third based on both demographics and visitation.

National Park visitation (which, as already noted, may implicitly account for demographics, since demographics are determinants of visitation).

We estimated several rank-ordered logit models in which weights were used to account for demographic differences and visitation rates.²⁵ Our total economic value results are quite robust to the various weighting procedures (see Appendix B: Additional Models). The results reported here in the main report are those from the best performing model (providing the most statistically efficient coefficient estimates—smallest standard errors—and therefore yielding the tightest confidence intervals around WTP) and the one that also yielded the lowest estimates of total economic value.

The National Parks model summarized in Table 9 performs well overall. Each individual coefficient is significant at the 99% confidence level and all have the expected sign. Most importantly, the coefficient on the annual cost of each option (tax) is negative and statistically significant, indicating respondents were paying close attention to the cost of each option. Put another way, the negative sign indicates that the higher the cost of that option, the less likely respondents were to choose it. Thus respondents appear to be making rational economic choices. Furthermore, the Wald statistic (distributed Chi-Square) indicates that the overall model is statistically significant.

Table 9. Results for National Parks – Rank-ordered Logit – weighted for NP visitation

<i>Dependent variable = Rank of the NPS Park policy option</i>				
	Coefficient	Std. Error	Z	P> z
Annual cost of option (federal income tax)	-0.0017724	0.0002924	-6.06***	0.000
Nature-focused NPS (cuts avoided)	2.49E-08	6.99E-09	3.57***	0.000

Water-focused NPS (cuts avoided)	3.60E-07	1.14E-07	3.14***	0.002
Number of observations = 1941	Wald Chi-Sq(4) = 232.03		Log pseudo-likelihood = -	
Number of groups = 647	Prob > Chi-Sq = 0.0000		1133.892	
(3 observations per groups)				

*** *significant at 99% confidence level*

Results for NPS programs are shown in Table 10. As with the parks model, the programs model performs well overall. All of the coefficients have the expected signs, and all but one (transfer of recreation lands to communities) are significant at the 95% level or higher. The Wald statistic indicates the overall model is statistically significant as well.

²⁵ Results for additional models estimated can be found in the Appendix.

Table 10. Results for National Park Programs – Rank-ordered Logit – weighted for NP visitation

Dependent variable = Rank of the NPS Program policy option

	Coefficient	Std. Error	Z	P> z

6. Estimates of Economic Value for National Parks and NPS Programs

The marginal or implicit prices for each type of National Park and NPS Program are estimated individually per unit (per acre, per site or per student). These marginal values are then multiplied by the number of acres, sites or students to arrive at a total value for each attribute. We then calculate Total Economic Value (TEV) by summing these park- or program-specific values.

Incremental (marginal) values for the attributes are calculated as the ratio of the attribute coefficient over the price coefficient (Holmes and Adamowicz 2003). Stata has a command that calculates the ratio and estimates the standard error and a confidence interval for this ratio (i.e., the incremental value). This gives us a range within which the estimated marginal and total values fall. The values implied by the rank-ordered logit regression results are shown in Table 11 (National Parks) and Table 12 (NPS Programs).

The last row in Table 11 labeled “All National Parks” contains two estimated values. The first is the TEV calculated based on the range of acres and historic sites protected (cuts avoided) presented in the survey. The avoided cuts that households were “buying” range from 10% to 40% of all National Parks. Thus the row labeled “TEV survey cuts avoided” reflects the sample range of cuts. The resulting WTP amounts are quite reasonable, with TEV amounting to \$523.86 per household, with a 95% confidence interval of \$377.52 to \$670.19. Unfortunately there are few other nationwide land preservation programs with which to compare our estimates. Just to provide some perspective, Walsh, et al. (1984) found Colorado households would pay on average \$91.14 (in 2014 dollars) to protect just 10 million acres of roadless land as Wilderness. Carson and Mitchell (1993) estimated the benefits of improving national water quality to swimmable conditions at \$438 per household (in 2014 dollars). Our per-household values for the cuts avoided are consistent with other nationwide environmental quality programs.

Table 11. Marginal and Per-Household Total Economic Values (TEV) for National Park Lands, Waters and Historic Sites

		<i>Estimated value</i>	<i>95% Confidence Interval for Estimated Value</i>	
Nature-focused	Marginal Value (per acre)	\$0.0000141	\$0.000006	\$0.00002.21
National Parks (79,096,632 acres)	Per household TEV for survey cuts avoided	\$189.21	\$83.54	\$294.88
	Per household Total Economic Value for all acres	\$1,113.24	\$491.51	1,734.97
History-focused	Marginal Value (per site)	\$3.87	\$1.74	\$6.00
National Parks (226 sites)	Per household TEV for survey cuts avoided	\$148.66	\$66.75	\$230.57
	Per household Total Economic Value for all sites	\$874.71	\$392.75	\$1,356.68
Water-focused	Marginal Value (per acre)	\$0.000203	\$0.00005.99	\$0.000346
National Parks (4,818,275 acres)	Per household TEV for survey cuts avoided	\$185.99	\$54.90	\$317.08
	Per household Total Economic Value for all acres	\$977.93	\$2,88.64	\$1,667.22
All National Parks	Per household TEV for survey cuts avoided	\$523.86	\$377.52	\$670.19
	Per household Total Economic Value for all acres/sites	\$2,967	\$2,144	\$3,787

Table 12. Marginal and Per-Household Values for NPS Programs

		<i>Estimated Value</i>	<i>95% Confidence Interval for Estimated Value</i>	
Historic sites and buildings protected each year (2,000)	Marginal Value (per site)	\$0.16	\$0.02	\$0.29
	Per household TEV for survey cuts avoided	\$48.40	\$7.47	\$89.32
	Per household Total Economic Value for all sites	\$316.31	\$48.82	\$583.80
Acres transferred to communities each year (2,700)	Marginal Value (per acre)	\$0.04	\$0	\$0.13
	Per household TEV for survey cuts avoided	\$15.20	\$0	\$54.60
	Per household Total Economic Value for all acres	\$98.41	\$0	\$353.53
Natural landmarks protected each year (114)	Marginal Value (per site)	\$3.05	\$0.71	\$5.40
	Per household TEV for survey cuts avoided	\$54.94	\$12.75	\$97.14
	Per household Total Economic Value for all sites	\$347.98	\$80.74	\$615.22
School children served by NPS educational programs each year (4.1 million)	Marginal Value (per student)	\$0.000167	\$0.000109	\$0.000224
	Per household TEV for survey cuts avoided	\$135.29	\$88.73	\$181.84
	Per household Total Economic Value for all students	\$682.62	\$447.70	\$917.53
All Programs Outcomes	Per household total value for cuts avoided	\$253.82	\$226.68	\$280.97
	Per household Total Economic Value for all NPS Programs	\$1,445	\$1,290	\$1,601

The final rows of Tables 11 and 12 represent scaling up the per acre or per site values to the entire National Park System (Table 11) and NPS Programs (Table 12) to arrive at a comprehensive total for the all National Parks and NPS programs.

This scaling up assumes the values per acre are linear. This is a typical convention used in applying the marginal values or implicit prices from a choice experiment. We tested for non-linearity using a quadratic rank-ordered logit model. None of the squared terms was statistically significant, and the overall performance of both non-linear rank-ordered logit models was inferior to the models presented in Tables 9 and 10. The lack of significance of the quadratic terms suggests that marginal values may in fact be *linear over the range of our data*.

However, when scaling up to all National Parks and NPS Programs we go beyond the range of the cuts in the survey. Given that we are extrapolating from the relatively flat portion of the Total Economic Value function *backwards* to the origin we have probably understated the Total Economic Value (see Figure 1).

Figure 1 (below) is a stylized version of a typical Total Benefits curve. This curve reflects the economic principle of diminishing marginal benefits. The principle states that as the quantity consumed of an identical good increases, the incremental gain in total benefits from each additional unit is a bit smaller than the benefit derived from prior units. This is easily seen when considering market goods, but it also applies to increasing quantity of an identical public good (Rollins and Lyke 1998). If there were no National Parks or NPS programs, the addition of the first National Park would have great value.

Figure 1. Diminishing Marginal Benefit of the National Parks and Programs

While it would have been ideal to ask households what they would have paid to avoid selling *all* the National Park units and stopping all NPS Programs, we felt this was not a credible scenario. In order to provide a realistic policy scenario in the survey, we proposed taking away only a portion of the National Parks and NPS programs due to budget cuts and the federal deficit. As illustrated in Figure 1, we took our per household values for 20% to 40% reductions in National Parks, and then applied that value for the average 20% cut to all 100% of the Parks or programs. The Parks and programs being "bought back" by survey respondents are in the flatter portion of the Total Economic Value curve due to diminishing marginal benefit (Rollins and Lyke 1998 and Walsh et al. 1984). Thus, the WTP to avoid the cuts proposed in the survey (20% to 40%) would likely be lower than the WTP to avoid cuts to the remaining 60% of National Parks and NPS programs. By applying the estimated marginal value to all the units and all the program outputs we are likely underestimating the total value of the National Park System in its entirety.

Despite this downward bias in our approach, scaling our estimate of WTP to avoid an average of 20% cuts and applying it to the WTP for maintaining 100% of the entire National Park System results in a substantial figure of \$2,967 a household. The equivalent WTP for all (100%) of the NPS Programs is \$1,445 per household. While the sum of these two WTPs is quite large, a typical household in our sample could still theoretically afford to pay it since the sum of the two figures represents about 7% of our samples' average household income. For lower income households, some might be able to afford to pay to avoid the 20% cuts but not to pay to avoid the full 100% cuts, since this amount would exceed their budget constraint. However, it must be remembered that an average WTP means that half the sample would pay this amount or more, while the other half would pay this amount or *less*. The "average" WTP per household does not imply that each and every household would pay the average amount. For example,

households that report they have visited National Parks in the last two years have higher Total Economic Values (TEV) since their TEVs include both visitor use and non-use/passive-use value. Households that do not visit National Parks have lower values per household since their TEVs are purely non-use/passive-use and do not include any current visitor use value. This can be seen by comparing WTP of visitors and non-visitors in Appendix Table B3.

It is worth noting that the values we estimated for the National Parks are much higher than those for the NPS programs. This is an indication that when confronted with an irreversible change (the sale of National Parks) the amount respondents would pay to avoid such an irreversible loss is higher than the amount they would pay to avoid what they may perceive as potentially reversible program cuts. Specifically this difference in economic values is likely due to the nature of these two public goods. The questionnaire proposed selling lands and sites within the National Park Service system. This would be an irreversible change. Reducing the funding for many of the NPS programs, on the other hand, is potentially reversible at some future date. It may result in some lost opportunities for historic or natural preservation but (as noted above) many of the iconic examples are protected within the Park system.

Calculating National Total Economic Value of National Parks and NPS Programs

We utilized income taxes as the way households would pay to prevent a reduction in the number of National Park lands/waters and historic sites, not because we propose that households should pay higher taxes but because taxes are a recommended, realistic and conservative way to elicit the amount that a household would pay for a public good (Carson and Groves 2007).

Despite starting with a representative sample, and using multiple mailings and reminders to complete the survey, our responding households had slightly higher incomes, higher education, and were older than the typical U.S. household. In addition we had a slightly higher proportion of National Park visitors in our sample compared to an independent survey of American households. Therefore in our non-market valuation analysis we used a standard statistical procedure to reweight the sample observations to reflect the population. We explored different variables to weight on, and choose the model that gave us the most conservative value, adjusting just for the National Park visitor percentages (the valuation estimates based on weighting for demographics and visitors were quite similar, just slightly higher).

Furthermore, in order to be extremely conservative in our valuation, we assumed that those households not responding to the survey after repeat mailings would not pay anything for preservation of National Parks or NPS programs. Using our response rate of 18% we took the average per household value estimated from our sample and multiplied it by 18% of the U.S. households (18% of 115.6 million U.S. households) and assumed zero benefits for the remaining 82% of households. This clearly understates the total value, since many households may simply choose not to answer lengthy surveys such as ours (12 pages) while still placing some value on National Parks and NPS programs.

Using this procedure our conservative estimated value is \$92 billion, of which \$62 billion is for National Parks and \$30 billion for NPS Programs which often exist outside the geographical boundaries of NPS units. Such programming is often cooperative in nature, with the NPS providing the backbone that holds together thousands of small jurisdictions and stakeholders in support of historical preservation, environmental stewardship, education and recreational opportunities in the communities.

We conclude that the estimated value of \$62 billion for National Parks is highly credible given that Neher, et al. (2013) estimated the recreation use value alone for the National Parks at \$28.5 billion. It makes sense that total economic value—which includes recreation use values and passive or non-use values—would be significantly larger. If we subtract the Neher, et al. estimate from our total economic value for National Parks, it yields an estimate of \$33.5 billion for the purely passive or non-use value—that is the existence and bequest value derived by the American public from just knowing that National Parks exist and will be available for future generations.

We believe our findings are quite conservative. A model based on weighting by Park visitation and demographics yielded \$67 billion for National Parks and \$32 billion for NPS Programs, for a total of \$99.5 billion.

Not only are the value calculations conservative, but they are based on what a household would pay to avoid sale of National Parks that they already collectively own. As discussed earlier in this report, in policy scenarios involving reducing the quantity or quality of a natural resource the public already “owns” or has a right to, willingness to accept (WTA), not willingness to pay, should be used as a measure of economic value. If we had chosen to conduct a choice experiment using WTA, the national values would likely have been much higher.

Our values are also in line with WTP estimates from other nationwide CVM surveys regarding environmental programs. Carson and Mitchell (1993: 2452) estimated a value of improving America’s rivers and lakes to a swimmable water quality at \$29.2 billion in 1983, equivalent to \$69.5 billion in 2015 dollars. This estimate is similar in magnitude to our estimate of the value of National Parks lands, waters and historic sites. A CVM study of the national benefits of maintaining air quality over just three southwest U.S. National Parks (Grand Canyon, Mesa Verde and Zion) was estimated by Schulze, et al. (1983: 166) at \$6.1 billion in 1980, with inflation adjusted benefits of \$17.8 billion in 2015. Given, that the Schulze et al. value is just for maintaining air quality over these three National Parks, not transferring them to the private sector, it suggests our estimates for maintaining the entire National Park System lands, waters and historic sites are conservative.

In short, the \$92 valuation represents the minimum amount that US households are willing to pay to *avoid the loss of* the NPS and its programs. We have adopted a conservative approach in several ways summarized below:

- Attributing value to the 18% of households who responded to the survey, attributing zero value to the remaining 82%. (As noted earlier, our follow-up sample confirmed that most non-respondents failed to respond due to factors that were un-related to the national parks, and indeed are overwhelmingly favorable to national parks.)
- Using "willingness-to-pay" (WTP) to keep National park lands/waters/historic sites instead of the more appropriate "Willingness-to-accept" (WTA) to give up these places that people already own. WTA is usually much larger than WTP for public goods.
- The survey did not drop “protest responses”—people who indicate they would not pay not because they don’t value National Parks or can’t afford to pay but for other reasons such as rejecting one or more premises of the survey—what is sometimes call scenario rejection.
- Valuing only a 20% to 40% reduction in National Park lands/waters and historic sites, but assumed that same value per acre or per site applied all the way to loss of 100% of all National Park lands/waters and historic sites. This is akin to estimating that a person would value the loss of five fingers at five times the value of losing one finger—when in fact a person would pay more to avoid the loss of all five fingers.
- Selecting the economic valuation model that gave us the lowest estimate of what households would pay.
- Excluding questions on the value of additional NPS activities, such as scientific research, ecosystem services and other sources of value.

The study could be improved upon in the future with a larger survey sample that would more accurately reflect the composition of the US population as a whole. In addition, a larger post-survey non-response follow up effort might have allowed for a more precise weighting adjustment procedure to deal with any potential sample selection bias. Such limitations could have been addressed with a larger budget.

7. Conclusion

Our results indicate that the American public's value for the non-market public goods produced by the National Park Service is substantial. The lands, waters, historic sites and programs of the National Park System are worth \$92 billion—at a minimum.

Of the \$62 billion that is related just to the geographical holdings of NPS, less than half of this represents the value of recreational use. The remainder is the value that American households place on *just knowing* that lands, waters and historic sites of the National Park System exist and will be available for future generations.

The NPS's educational programs and programs aimed at conservation, education, and stewardship of historic and cultural sites are valued by the American public at \$30 billion. These programs benefit millions of Americans who visit protected properties as well as large numbers of teachers and students who use educational curricula materials developed by NPS. This figure may well underestimate the value that the public places on the NPS role in protecting ecosystems, watersheds, intellectual property and other assets that were not specifically tested in this survey.

Despite these limitations, we are confident that our estimates represent a minimum economic value for NPS assets and programs. The results are based on a highly conservative methodology. Our value calculations omit completely the economic value of the NPS to hundreds of millions of people worldwide, a significant number of whom come as tourists to visit the National Parks, or who value the existence of these places. Moreover the findings are supported by a number of recent opinion that polls that provide evidence of strong support for public lands in general²⁶ and the National Parks in particular.²⁷

Our findings should be of interest both to researchers and to policymakers when considering the appropriate level of budgetary resources needed to maintaining this significant national asset.

8. Acknowledgements

This report benefited from survey design and review of statistical analysis provided by Dr. Barbara Kanninen of BK Econometrics, and initial study design and draft report review by Dr. John Duffield, University of Montana. We are grateful for the assistance of Dr. Brian Harnisch at Wyoming Survey and Analysis Center, University of Wyoming, Laramie, WY. Additional review and input was gratefully received from Dr. Dan McCollum and Dr. Tom Holmes of the U.S.D.A. Forest Service and Brian Quay, now with the U.S. Geological Survey.

We also acknowledge the contributions of several individuals at the Harvard Kennedy School, including former students Adam Banasiak, Francis Choi, Timothy Marlowe, Stephen Thompson and Thomas Liu; and Scott Leland of the Mossavar-Rahmani Center for Business and Government.

We benefitted from the input and assistance of a number of individuals in the National Park Service, including Dr. Bruce Peacock, Director Jonathan Jarvis, Loran Fraser, Dr. Lynne Koontz, Dr. Leslie Richardson, and numerous NPS employees at units including Minute Man Historical Park, Golden Gate NRA, Ellis Island, Joshua Tree, Everglades, Saguaro, Chesapeake Bay and Santa Monica NRA. We also thank a number of people who have advised us on portions of the research, including Dr. Milton Chen, Dr. Rita Colwell, Dr. Sylvia Earle, Professor Henry Louis Gates, Jr., Belinda Faustinos, Gretchen Long, Dr. Colin Mayer (Oxford University). We also thank the members of the NPS Advisory Committee and the members of the NPCA Second Century Commission who first envisaged this project.

We are grateful for the funding for this research, which has been provided by the S. D. Bechtel, Jr. Foundation, the Turner Foundation, Cody J. Smith (Summit Foundation), the National Park Foundation and UPD Consulting. We especially thank Tina Batt and Cody J. Smith for their vision in bringing this study to fruition.

None of these funding groups or individuals is responsible for the content of the report and conclusions, which are solely those of the authors.

10. Appendix

A. Questionnaire

**Your National Park Service
Lands & Programs:
What Do You Think?**

Colorado State University is conducting a survey on public attitudes toward the National Park Service. It is important that we hear from everyone. Your opinion is valuable even if you have not visited any National Parks or participated in any type of National Park programs.

- The first two pages contain some background information.
- The survey questions begin on page 4.

Every state contains one or more of the 402 National Park Service areas.

The National Park Service manages three kinds of areas:

National Park areas that focus on the preservation of nature and nature-based recreation. These include:

- **National Parks** such as Yellowstone (WY, MT, ID) and Acadia (ME)
- some **National Monuments** such as Devils Tower (WY) and Cedar Breaks (UT)
- **National Preserves** such as Big Cypress (FL) and Tallgrass Prairie (KS)
- **National Parkways** such as The Blue Ridge Parkway (NC, VA) and The John D. Rockefeller Memorial Parkway (WY)
- **National Scenic Trails** such as The Appalachian Trail (which runs through 14 states from ME to GA).
- some **National Recreation Areas** such as the Santa Monica Mountains (CA) and Bighorn Canyon (MT, WY)

There are 79 million acres of National Park areas that focus on nature and nature-based recreation.

National Park areas that focus on the preservation of American history and culture or the commemoration and remembrance of significant events and people. These include:

- **National Historic Sites** such as Theodore Roosevelt Birthplace (NY) and The Tuskegee Airmen National Historic Site (AL)
- **National Battlefields** such as Antietam (MD) and Gettysburg (PA)
- **National Memorials** such as The Presidential memorials and the Flight 93 National Memorial (PA)
- some **National Monuments** such as the First State National Monument (DE) and The Statue of Liberty (NY)

There are 226 National Park areas that focus on historic preservation.

National Park areas that focus on protecting shorelines and bodies of water. These include:

- **National Lakeshores** on the Great Lakes such as Apostle Islands (WI) and Sleeping Bear Dunes (MI)
- **National Seashores** such as Padre Island (TX) and Point Reyes (CA)
- **National Rivers** such as The Rio Grande Wild & Scenic River (TX) and The Mississippi National River & Recreation Area (MN)
- some **National Recreation Areas** such as Lake Mead (AZ, NV) and Lake Meredith (TX)

There are 4.8 million acres of National Park areas that focus on protecting shorelines and bodies of water.

The National Park Service also provides many programs outside of the National Parks, in communities in every state.

These programs have several purposes, including:

Preservation of local historic buildings and sites which commemorate American history and culture or significant events and people.

These programs provide assistance to residents and communities wishing to protect local historic sites and buildings outside of the National Parks. This includes:

- Providing grants for historic preservation
- Giving advice on preservation
- Administering tax credits for renovation and preservation of historic sites
- Maintaining the National Register of Historic Places
- Protect sites on the Underground Railroad,
- Protecting lighthouses and historic battlefields which are outside of National Parks

Each year these programs result in the protection of 2,000 historic sites and buildings (outside of National Parks) in communities throughout the country.

Creation and improvement of recreation opportunities for communities.

These programs help communities provide recreation facilities such as community parks, trails and open spaces through:

- Coordination and planning
- Helping to transfer other (non-National Park) federal lands to local communities for recreation areas.

Each year these programs help to transfer 2,700 acres of land to communities for parks, trails, open spaces and other recreational amenities.

Protection of natural environments and features which are important to communities.

The National Park Service works with local communities and landowners to protect local ecological, biological or geological features such as:

- Unusual landscapes
- Rock formations
- Waterfalls
- Geothermal pools

Each year these programs help designate 114 sites in communities.

Educational programs which help children and adults learn about historical, cultural and environmental topic.
This includes:

- Producing educational materials for use in classrooms
- Helping bring students to parks and historical sites
- Training teachers to use historic sites and other areas in their lessons
- Training state and local professionals in historic restoration, preservation and renovation.

Each year these programs enable 4.1 million school children to attend educational programs about nature and history.

8. I do not benefit directly from National Parks.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Private businesses could probably do a better job than the federal government at protecting local historic sites and buildings.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. It is important to me that trails, parks, and open spaces in communities are protected for current and future generations, whether I use them or not.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11. National Parks are important to me because I enjoy visiting them.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12. It is important to me that National Parks are preserved for current and future generations whether I visit them or not.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

The federal government is running a large deficit and is considering selling some National Park areas (described on page 2) and cutting some National Park Service programs (described on page 3) to save money.

- National Park areas sold to private landowners would no longer have the current level of public access. These lands may be developed for houses, offices, resorts or other developments. They may also be used for timber harvesting, oil and gas development or mining.
- Some land in all National Park areas in every state would potentially be sold.
- Program cuts would potentially apply to all types of programs and would be spread across every state.

One proposal to avoid the sale of National Park areas and cuts to the National Park Service facilitated programs is to set up a special fund dedicated to the National Park Service.

- The dedicated fund would be paid for by an increase in the federal income tax.
- The increase would be paid annually and would last for 10 years.
- All U.S. households would pay the tax.

On the next page you will be asked to decide whether you would choose to raise taxes to avoid selling National Park areas and cutting National Park Service programs.

- Your answers will be used to help the federal government compare the cost of the National Park Service with the benefits to American households. The answers you give could affect the amount of National Park areas and National Park Service programs available in the future and the amount of taxes you pay.
- In making this decision, please take into account your household income, whether you can afford to make the payment shown, and whether National Park areas and National Park Service community programs are worth that much to you.
- Consider everything else you could buy with the money and whether there are other government programs that you might rather see money spent on.

You will be asked two separate questions, one on National Park areas and another on National Park Service facilitated programs. Please consider the combined cost for the two questions when giving your answer.

OPTIONS FOR NATIONAL PARK AREAS

Options A and B are proposals to sell land in some or all of each type of National Park area.

Option C would retain all current National Park areas.

The option chosen by a majority of households will be carried out, and all households will pay the amount specified. There is no right or wrong answer, please choose the option that is best for you.

At the bottom of this table, please check the boxes to indicate your most preferred option and your least preferred option:

	Option A Sale of some land in all parks	Option B Smaller land sales in some or all parks	Option C No sale of park lands
 <p>National Park areas that focus on the preservation of nature and nature-based recreation.</p>	 <p>Acres sold: 19,774,158 25%</p> <p>Acres kept: 59,322,474 75%</p>	 <p>Acres sold: 7,909,663 10%</p> <p>Acres kept: 71,186,969 90%</p>	 <p>No sale – keep all 79,096,632 acres</p>
 <p>National Park areas that focus on the preservation of American history and culture.</p>	 <p>Historic sites sold: 57 25%</p> <p>Historic sites kept: 170 75%</p>	 <p>No sale – keep all 226 sites</p>	 <p>No sale – keep all 226 sites</p>
 <p>National Park areas that focus on protecting shorelines and bodies of water.</p>	 <p>Acres sold: 1,927,310 40%</p> <p>Acres kept: 2,890,965 60%</p>	 <p>Acres sold: 722,741 15%</p> <p>Acres kept: 4,095,534 85%</p>	 <p>No sale – keep all 4,818,275 acres</p>
Your household's annual tax cost for each of the next 10 years:	for Option A: \$0	for Option B: \$150	for Option C: \$400
1. Select Your Single <u>Most Preferred</u> Option:	Option A <input type="checkbox"/>	Option B <input type="checkbox"/>	Option C <input type="checkbox"/>
2. Select Your Single <u>Least Preferred</u> Option:	Option A <input type="checkbox"/>	Option B <input type="checkbox"/>	Option C <input type="checkbox"/>

3. If there were only two choices regarding the sale of National Park areas: **Option A** (selling parts of all types of National Park areas) or **Option C** (retaining all current National Park areas) as described above where your household would have to pay an annual tax of \$400 for ten years, would you choose Option C?

- Yes** **No**

4. On a scale from 1 to 10, where 1 is “very uncertain” and 10 is “very certain,” please circle the number that best describes how certain you are that you would actually choose the option you checked in question 3 (above) if you actually had to pay.

Very uncertain									Very certain
1	2	3	4	5	6	7	8	9	10

5. If you selected Option **B or C** as your most preferred option for question 1 (on page 6), go to Question 6 on the next page. If you selected Option **A** as your most preferred option please tell us why (check the **single** most important reason).

- National Park areas are not worth that much to me.
- I can't afford to pay that much.
- We need to cut all government spending so we can reduce the federal deficit.
- Taxes are too high already.
- Only the people who use National Park areas should have to pay for them.
- National Park areas should be paid for with existing tax dollars.
- Other (please describe):

OPTIONS FOR PROGRAMS IN COMMUNITIES

Options D and E are proposals to make cuts or reductions to some or all types of programs in local communities.

Option F would keep all programs in local communities at their current levels.

The option chosen by a majority of households will be carried out, and all households will pay the amount specified. There is no right or wrong answer, please choose the option that is best for you.

At the bottom of this table, please check the boxes to indicate your most preferred option and your least preferred option:

	Option D Cuts to all programs	Option E Smaller cuts to some or all programs	Option F No cuts to programs
 <p>Additional local historic sites and buildings outside of National Parks protected each year.</p>			
 <p>Additional non-National Park acres transferred to communities for recreation each year.</p>			
 <p>Natural areas which are important to communities protected each year.</p>			
 <p>Number of school children who attend educational programs produced by the National Park Service each year.</p>			
Your household's annual tax cost for each of the next 10 years	for Option D: \$0	for Option E: \$60	for Option F: \$100
6. Select Your Single <u>Most Preferred</u> Option:	Option D <input type="checkbox"/>	Option E <input type="checkbox"/>	Option F <input type="checkbox"/>
7. Select Your Single <u>Least Preferred</u> Option:	Option D <input type="checkbox"/>	Option E <input type="checkbox"/>	Option F <input type="checkbox"/>

8. If there were only two choices regarding cutting National Park Service programs: **Option D** (the reduction of all National Park Service programs) or **Option F** (retain all current National Park Service programs) as described above where your household would have to pay an annual tax of \$100 for ten years, would you choose Option F?

- Yes No

9. On a scale from 1 to 10, where 1 is “very uncertain” and 10 is “very certain,” please circle the number that best describes how certain you are that you would actually choose the option you checked in question 8 (above) if you actually had to pay.

Very uncertain										Very certain
1	2	3	4	5	6	7	8	9	10	

10. If you selected Option **E or F** as your most preferred option for question 6 (on page 8) go to Question 11. If you selected Option **D** as your most preferred option please tell us why (check the **single** most important reason).

- National Park Service programs are not worth that much to me.
- I can't afford to pay that much.
- We need to cut all government spending so we can reduce the federal deficit.
- Taxes are too high already.
- Only the people who use National Park Service programs should have to pay for them.
- National Park Service programs should be paid for with existing tax dollars.
- Other (please describe):

11. How certain are you that your answers would be used by the federal government to decide whether to sell National Park areas and/or to cut National Park Service programs?

- Very certain Certain Neither certain nor uncertain Uncertain Very uncertain

12. How certain are you that you would actually have to pay the tax increase to avoid the sale of National Park areas and/or the cuts to National Park Service Programs?

- Very certain Certain Neither certain nor uncertain Uncertain Very uncertain

Next, we would like to know about you and your recreational activities. Your answers to these questions will only be used to see how well our survey sample represents the American public as a whole. Your answers are confidential. You will not be identified in any way.

1. In the last 2 years have you participated in any outdoor activities anywhere, not just in the National Parks? (Check all that apply.)

- | | |
|---|---|
| <input type="checkbox"/> Visited a beach, a lake or a reservoir | <input type="checkbox"/> Gone hiking |
| <input type="checkbox"/> Watched birds or other wildlife | <input type="checkbox"/> Gone camping |
| <input type="checkbox"/> Visited local historic sites | <input type="checkbox"/> Visited local open spaces, trails or parks |
| <input type="checkbox"/> Visited local natural areas where ecological or geological amenities are featured. | <input type="checkbox"/> Participated in local natural or historical education programs |
| <input type="checkbox"/> Other outdoor activities (please describe) _____ | |

2. In total, how often did you do all of the activities you checked above in the last 2 years?

- 1 to 3 times 4 to 5 times 6 to 9 times 10 to 19 times 20 or more times

3. Have you visited any of National Park areas anywhere in the U.S. in the past 2 years?

- Yes No → **If No please skip Questions 4 and 5.**

4. Which types of National Park areas you have visited in the last 2 years (check all that apply):

National Park areas that focus on the preservation of nature and nature-based recreation.

(National Parks, some National Monuments, National Preserves, National Parkways, National Scenic Trails, and some National Recreation Areas)

National Park areas that focus on the preservation of American history and culture or the commemoration and remembrance of significant events and people.

(National Historic Sites, National Battlefields, National Memorials, and some National Monuments)

National Park areas that focus on protecting shorelines and bodies of water.

(National Lakeshores on the Great Lakes, National Seashores, National Rivers, and some National Recreation Areas)

5. In total, how often did you visit any type of National Park area in the last 2 years?

- 1 to 3 times 4 to 5 times 6 to 9 times 10 or more times

6. Do you belong to any local, state or national organizations whose main purpose is to protect National Parks or other federal public lands?

- Yes No

7. What is your zip code? _____
8. Are you: Male Female
9. In what year were you born? _____
10. Are you retired? Yes No
11. How would you describe your overall political point of view?
- Mostly Democratic Leaning Republican Completely independent
- Leaning Democratic Mostly Republican Not sure
12. What is the highest level of school you have completed
- Some high school High school graduate or equivalent
- Some college or technical school (but no degree) Associate's degree (including occupational or academic degrees)
- Bachelor's degree (BA, BS, AB, etc.) Master's degree (MA, MS, MENG, MSW, etc.)
- Doctoral degree (PhD, EdD, etc.) Professional school degree (MD, DDC, JD, etc.)
13. Here is a list of racial categories. Please select one or more which best describes your race:
- American Indian or Alaska Native Native Hawaiian or other Pacific Islander Asian
- Black or African American White Other _____
14. Are you Hispanic or Latino? Yes No
15. Next we'd like to ask you about your household income. Your answer will be kept strictly confidential, and only used for comparing groups of people. Which of the following income categories best describes your household's total income in 2012, before taxes?
- Less than \$15,000 \$15,000 up to \$24,999 \$25,000 up to \$34,999
- \$35,000 up to \$49,999 \$50,000 up to \$74,999 \$75,000 up to \$99,999
- \$100,000 up to \$149,999 \$150,000 up to \$199,999 \$200,000 or more
16. What is the total number of people who contribute to the household income noted above? _____ (number)
17. How many children under the age of 18 are in your household? _____ (number)

Thank you for taking time to help us out with this project. Do you have any additional comments you would like to add?

B. Additional Models

This section compares the results of the rank-ordered logistic regression and the marginal and total value calculations for all of the models which we estimated in the course of analyzing this data. The first two tables compare the seven regression models for parks (Table B1) and six regression models for programs (Table B2). The second two tables (Tables B3 and B4) show the estimated marginal and total values for all of the parks models and programs models respectively.

Table B1. Comparison of Rank-ordered Logit Models for National Parks

		<i>Nature-focused NPS acres</i>	<i>History-focused NPS sites</i>	<i>Water-focused NPS acres</i>	<i>Annual cost of option (tax)</i>
1. Base Model-no weights	<i>Coefficient (Std. Error)</i>	2.93E-08 *** (7.74E-09)	0.0074264 *** (0.00221)	4.41E-07 *** (1.22E-07)	-0.0017935*** (0.0002913)
2. Weighted for demographics	<i>Coefficient (Std. Error)</i>	2.48E-08 ** (9.56E-09)	0.0052674 ** (0.0025794)	0.00000038 ** (1.68E-07)	-0.0011557 *** (0.0004327)
3. Weighted for National Park visitation	<i>Coefficient (Std. Error)</i>	2.49E-08 *** (6.99E-09)	0.0068598 *** (0.0017039)	0.00000036 *** (1.14E-07)	-0.0017724 *** (0.0002924)
4. Weighted for demographics & Park visitation	<i>Coefficient (Std. Error)</i>	2.1E-08 ** (9.5E-09)	0.0063523 ** (0.0029127)	0.00000037 ** (1.71E-07)	-0.0015292 *** (0.0004411)
5. National Park Visitors only	<i>Coefficient (Std. Error)</i>	3.12E-08 *** (1.07E-08)	0.0079144 *** (0.002971)	5.69E-07 *** (1.69E-07)	-0.00116 *** (0.0003724)
